Pillow Block with Pressed Steel Covers

# ASAHI BEARING UNITS

## CONSTRUCTION OF BEARING UNITS

ASAHI Bearing Units consist of a double sealed single row deep groove ball bearing and any one of cast iron, synthetic rubber or pressed steel housings of various configurations.

The self-contained bearing with spherical ground outside diameter is assembled into a corresponding spherical seat of the housing providing self-alignment of the bearing in the housing at

## FEATURES OF BEARING UNITS

### Rational self-alignment

The outside diameter of the self-contained bearing is ground spherical to match corresponding spherical inside diameter of the housing providing self-alignment between these two members, which compensates for misalignments of the units resulting from errors in mounting and distortion of the foundation.

### Larger load carrying capacity

Being the same as 6200 and 6300 series single row deep groove radial ball bearings in internal construction of the self-contained bearing, Bearing Units can sustain radial loads and substantial thrust loads as well. Quiet operation is also assured.

### Longer service life

Bearing Units are often used in severe operating conditions where they are exposed to dirt, moisture or high temperature, and in such applications, the grease inside the self-contained bearing deteriorates in a short period of time. It is required, therefore to relubricate the units at suitable intervals so as to replace deteriorated grease with fresh grease.

ASAHI Bearing Units with cast iron and rubber housings are all relubricable type equipped with grease fittings to secure full performance and longer service life of the units under any operating condition.

### Efficient sealing

The self-contained bearing is double sealed with a combination of heat-resistant oil-proof synthetic rubber seal and steel slinger. The outside steel slinger which is fixed to the inner ring and rotates together with it effectively prevents foreign matters from entering into the bearing from the atmosphere and protects the bearing against outside pressure. The steel backed rubber seal on inside which is fixed to the outer ring contacts the land of the inner ring with a light rubbing pressure. The combination of these two sealing elements serve to exclude dirt and moisture and to retain the grease within the bearing chamber insuring full performance of the bearing even in severe operating conditions. Bearing Units with Covers are developed for applications where surroundings and atmospheric conditions are extremely severe such as in steel mills, flour mills, foundries, etc. With the double sealing of the self-contained bearing and dust covers of the housing, sealing ability of the units with covers is perfect.

### Solid housing

The cast iron housing is of solid one-piece construction to provide maximum rigidity against deformation at mounting and wear resistance for any operating condition.

mounting. Set-screw locking is most popular method of mounting to the shaft. Adapter sleeve and eccentric locking collar are also available. For services under more severe operating conditions, Bearing Units with Cast Iron Covers and Pressed Steel Covers are available as standard types.

#### Easy and positive locking to shaft

There are three methods of locking Bearing Units to the shaft. Locking by means of two set-screws in the extended inner ring is the most common method. Adapter sleeve locking and an eccentric locking collar are also available. All these locking methods offer easy installation of the units and machining of the shafts.

**Special heat-treatment on bearing inner ring**  
As shown in the figure below, the inner ring of the self-contained bearing is hardened in the race-way and surrounding part where hardening is necessary, while the extended part where the set-screws are installed is left metallurgically mild and tenacious. This special heat-treatment ensures full bearing performance and prevents the set-screws from loosening during operation as the set-screws can be tightened hard enough without causing destructive inner ring cracking.

#### Unique device to prevent bearing outer ring rotation

The bearing outer ring is equipped with a unique locking-pin device which permits free self-alignment of the units, and also prevents outer ring rotation. The result - longer service life.

#### Complete interchangeability between bearing and housing

Skilled precision workmanship on the self-contained bearing and the housing provides complete interchangeability between them and the bearing can be easily replaced whenever so required.

#### Easy installation

The self-contained bearing is prelubricated with an adequate quantity of high quality grease. Bearing Units can be mounted on the shaft for immediate operation. The units are, therefore, free from ingress of harmful contaminants into the bearing chamber during mounting procedures.

#### Easy positioning for mounting

Two dowel bases provided on the housing of Pillow Block, Square Flange and Two-Bolt Flange Units serve for easy and accurate positioning of the units when mounting them on the structure.

For availability of the former FG 200+ER, please check with us.

# ASAHI

## BALL BEARING UNITS

SILVER series

STAINLESS SILVER series

● **QUICK, ACCURATE POSITIONING BY CENTER-LINE MARKS**

Center-line marks provided on housing offer easy, quick and exact positioning, eliminating need for adjustment after mounting. For positioning, just scribe the lines on supporting frame and match them with the center-line marks.

● **COMPACT & LIGHT-WEIGHTED**

This feature permits high performance and more space-saving machine and equipment designs.

● **EASY & QUICK TO MOUNT**

Eccentric locking collar ensures fast and positive locking of bearing to the shaft.

● **HIGH SEALING EFFICIENCY**

Bearings are effectively sealed. For added protection against dust and humid, units fitted with stainless steel end covers are also available.

● **HIGH ANTI-CORROSIVENESS (STAINLESS SILVER series)**

Suitable for applications under adverse environmental conditions.

● **HIGH SPEED OPERATION**

Compact bearing design permits high speed operation.

### ● Tolerances

In conformity with JIS B1558 on ball bearings for units and JIS B1559 on housings for bearing units.

### ● Operating temperature range

-10°C to +80°C. For operating temperature beyond this range, please consult us.

### ● Shaft selection

Unit: μm

Shaft dia. (mm)	Over	Incl.	Unit: μm	
			js7	h7
6	10		± 7.5	0 ~ -15
10	18		± 9	0 ~ -18
18	30		± 10.5	0 ~ -21
30	50		± 12.5	0 ~ -25

Note: Use tight fit for applications involving high speed and vibration.

# ENGINEERING DATA

### IMPORTANT NOTICE

This edition contains revised "Basic Dynamic Load Ratings".

The new basic dynamic load ratings, whose C values are increased by 30% over the values contained in our previous publications, have resulted from the improved life properties of our bearings, and the new values supersede the old ones.

Calculations of dynamic load ratings and rating lives of the bearings are in conformity with the standards established by ISO 281/1-1977 (corresponding JIS 1518-1981), which formulates the adjusted rating life as follows: —

$$L_{na} = a_1 a_2 a_3 L_{10}$$

where:

$$L_{10} = \left( \frac{C}{P} \right)^3$$

$L_{na}$  : Adjusted rating life in millions of revolutions taking into account reliability (100 — n)%, where the index "n" represents the difference between the requisite reliability, bearing materials and operating conditions.

$a_1$  : Life adjustment factor for reliability

$a_2$  : Life adjustment factor for materials

$a_3$  : Life adjustment factor for operating conditions

Please note that the new basic dynamic load ratings have been determined taking into account the fact that the standard bearing steels used for our bearings have better life properties than the materials on which the equation by ISO are based. Therefore, when using these new load ratings, the value for  $a_2$  factor should be  $a_2 = 1$ . Other values, i.e.,  $a_1$  and  $a_3$  factors should be properly used according to the guidances given in the same standard.

Load Rating Data on page 80 — 81 and other related figures and values are based on new basic dynamic load ratings.

# 1. TOLERANCES FOR BEARING UNITS

## 1.1 Tolerances for bearings

### 1) Inner rings

Table 1.1 Tolerances on inner rings of bearings with cylindrical bore

Unit: 0.001 mm  
(0.0001 in.)

Nominal bore diameter $d$				Deviation of mean bore diameter in plane of inner ring		Variation of bore diameter in plane of inner ring	Deviation of inner ring width		Radial runout of inner ring	Eccentricity deviation of inner ring and eccentric locking collar
Over		Incl.		$\Delta dmp$		$Vdp$	$\Delta B_s$ (reference)		$K_{10}$ (reference)	$\Delta H_s$
mm	in.	mm	in.	High	low	Max.	High	Low	Max.	
6	0.2362	10	0.3937	+12 (+5)	0	8 (3)	0	-120 (-47)	15 (6)	±100 (±39)
10	0.3937	18	0.7087	+15 (+6)	0	10 (4)	0	-120 (-47)	15 (6)	
18	0.7087	31.75	1.2500	+18 (+7)	0	12 (5)	0	-120 (-47)	18 (7)	
31.75	1.2500	50.8	2.0000	+21 (+8)	0	14 (6)	0	-120 (-47)	20 (8)	
50.8	2.0000	80	3.1496	+24 (+9)	0	16 (6)	0	-150 (-59)	25 (10)	
80	3.1496	120	4.7244	+28 (+11)	0	19 (7)	0	-200 (-79)	30 (12)	—
120	4.7244	180	7.0866	+33 (+13)	0	22 (9)	0	-250 (-98)	35 (14)	—

Theoretical tapered bore

Actual tapered bore with deviation of mean bore diameter in plane of inner ring

Table 1.2 Tolerances on inner rings of bearings with tapered bore

Unit: 0.001mm  
(0.0001in.)

Nominal bore diameter $d$				Deviation of mean bore diameter in plane of inner ring at the narrower edge		$\Delta dmp - \Delta dmp$		Variation of bore diameter in plane of inner ring(1)
Over		Incl.		$\Delta dmp$		$Vdp$		
mm	in.	mm	in.	High	Low	Max.	Min.	
18	0.7087	30	1.1811	+33 (+13)	0	+21 (+8)	0	13 (5)
30	1.1811	50	1.9685	+39 (+15)	0	+25 (+10)	0	16 (6)
50	1.9685	80	3.1496	+46 (+18)	0	+30 (+12)	0	19 (7)
80	3.1496	120	4.7244	+54 (+21)	0	+35 (+14)	0	22 (9)
120	4.7244	180	7.0866	+63 (+25)	0	+40 (+16)	0	40 (16)

Note: (1) Applicable to all radial planes of tapered bore.

### 2) Outer rings

Table 1.3 Tolerances on outer rings

Unit: 0.001mm  
(0.0001in.)

Nominal outside diameter $D$				Deviation of mean outside diameter		Radial runout of outer ring
Over		Incl.		$\Delta Dm$		$K_{20}$ (reference)
mm	in.	mm	in.	High	Low	Max.
18	0.7087	30	1.1811	0	-9 (-4)	15 (6)
30	1.1811	50	1.9685	0	-11 (-4)	20 (8)
50	1.9685	80	3.1496	0	-13 (-5)	25 (10)
80	3.1496	120	4.7244	0	-15 (-6)	35 (14)
120	4.7244	150	5.9055	0	-18 (-7)	40 (16)
150	5.9055	180	7.0866	0	-25 (-10)	45 (18)
180	7.0866	250	9.8425	0	-30 (-12)	50 (20)
250	9.8425	315	12.4016	0	-35 (-14)	60 (24)

Note: The values of the low of  $\Delta Dm$  shall not be applicable to the distance within 1/4 the width dimension of outer ring from the outer ring surface.

- 3) Distance between radial plane passing through center of sphere of outer ring and side of inner ring.

Table 1.4 Distance "n" between radial plane passing through center of sphere of outer ring and side of inner ring

Nominal bore diameter d				n	
Over		Incl.		Deviations	
mm	in.	mm	in.	mm (0.001 mm)	in. (0.0001 in.)
		50	1.9685	± 200	± .79
50	1.9685	80	3.1496	± 250	± .98
80	3.1496	120	4.7244	± 300	± 1.18
120	4.7244			± 350	± 1.38

1.2 Tolerances for housings

- 1) Tolerances on spherical inside diameter of housings

Table 1.6 Tolerances on spherical inside diameter

Nominal diameter of spherical bearing seating D <sub>s</sub>				Tolerance range class H7		Tolerance range class J7		Tolerance range class K7				
				Deviation of mean bore diameter in plane of inner ring of spherical seat		Variation of bore diameter in plane of inner ring of spherical seat		Deviation of mean bore diameter in plane of inner ring of spherical seat		Variation of bore diameter in plane of inner ring of spherical seat		
Over		Incl.		D <sub>min</sub>		D <sub>max</sub>		D <sub>min</sub>		D <sub>max</sub>		
mm	in.	mm	in.	High	Low	Max.	High	Low	Max.	High	Low	Max.
30	1.1811	50	1.9685	+25 (+10)	0	10 (4)	+14 (+6)	-11 (-4)	10 (4)	7 (3)	18 (7)	10 (4)
50	1.9685	80	3.1496	+30 (+12)	0	12 (5)	+18 (+7)	-12 (-5)	12 (5)	9 (4)	21 (8)	12 (5)
80	3.1496	120	4.7244	+35 (+14)	0	14 (6)	+22 (+9)	-13 (-5)	14 (6)	10 (4)	25 (11)	14 (6)
120	4.7244	180	7.0866	+40 (+16)	0	16 (6)	+26 (+10)	-14 (-6)	16 (6)	12 (5)	28 (11)	16 (6)
180	7.0866	250	9.8425	+46 (+18)	0	18 (7)	+30 (+12)	-16 (-6)	18 (7)	13 (5)	33 (13)	18 (7)
250	9.8425	315	12.4016	+52 (+20)	0	20 (8)	+36 (+14)	-16 (-6)	20 (8)	16 (6)	36 (14)	20 (8)

Note: (1) Dimensional tolerances on spherical inside diameter of housings are classified into H for clearance fit K for interference fit and J for intermediate fit between H and K. As the self-contained bearings are equipped with locking-pin, clearance fit H is normally applied.

- 4) Chamfer dimensions

Table 1.5 Chamfer dimensions

Unit: mm (in.)

Nominal chamfer dimensions r	r	
	Max.	Min.
1 (.039)	1.3 (.059)	0.6 (.024)
1.5 (.059)	2 (.079)	1 (.039)
2 (.079)	2.5 (.098)	1.5 (.059)
2.5 (.098)	3 (.118)	2 (.079)
3 (.118)	3.5 (.138)	2.5 (.098)
3.5 (.138)	4 (.157)	2.5 (.098)
4 (.157)	4.5 (.177)	3 (.118)
5 (.197)	6 (.236)	4 (.157)

Note: Chamfer dimensions do not control the shape of the bearing corner, but the profile shall fall within the shaded area shown below.

## 2) Tolerances for Pillow Block type housings (P, IP, PH)

Table 1.7 Pillow Block type housings (P, IP, PH)

Unit: 0.001 mm  
(0.0001 in.)

Bearing No.						h Deviation	h Deviation IP200, IP300	
P 203	-	-	-	-	-	± 150 (± 59)	± 700 (± 276)	
P 204	-	-	-	-	PH 204			
P 205	P 305	P X05	-	-	-			PH 205
P 206	P 306	P X06	-	-	-			PH 206

63	2.4803	250	9.8425	± 0.5 (± 0.020)

Table 1.13 Casting tolerances

1) Tolerances on length

Unit: mm  
(in.)

Nominal dimension	up to 100 incl.	100 up to 200 incl.	200 up to 400 incl.	400 up to 800 incl.
Dimensional tolerances	± 1.5 (± 0.059)	± 2.0 (± 0.079)	± 3.0 (± 0.118)	± 4.0 (± 0.157)

2) Tolerances on thickness

Nominal dimension	up to 5 incl.	5 up to 10 incl.	10 up to 20 incl.	20 up to 30 incl.	30 up to 40 incl.
Dimensional tolerances	+ 1.0 (± 0.039)	+ 1.5 (± 0.059)	+ 2.0 (± 0.079)	+ 3.0 (± 0.118)	+ 4.0 (± 0.157)

3) Tolerances on draft taper

Draft taper	Inside	Outside
Deviations	$\frac{3}{100}$	$\frac{5}{100}$

- Note: (1) Dimensional tolerances and deviations are for ordinary grade.  
(2) Dimensional tolerances on length and thickness may be added with deviations on draft taper.

## 2. LOAD AND LIFE OF BEARING UNITS

As load capacity and life of Bearing Units are same as those of the self-contained bearing, they are calculated in the same method as ordinary ball bearings.

### 2.1 Bearing loads

#### 1) Dynamic factors

In general, bearings are subjected to weight of rolling elements themselves, forces due to belt or gear drive and various kinds of loads produced by operation of the machine. Besides them, operation of the machine is accompanied by shocks and vibrations, small or heavy, and it is practically difficult to obtain these loads specifically by calculations.

Therefore, the loads on the self-contained bearing are to be obtained by multiplying calculable values by factors which are determined through experiences. These factors are generally classified as follows and called Dynamic Factors collectively.

- Belt factor  $f_b$  : Belt (or chain) drive
- Gear factor  $f_g$  : Gear drive
- Machine factor  $f_d$  : All types of drive

#### (1) Belt (or chain) drive

The radial load imposed on the pulley (or sprocket) shaft by belt or chain drive is calculated as follows.

$$M = 97400 \frac{H}{n} \quad (2.1)$$

$$K_b = \frac{M}{r} \quad (2.2)$$

where:

- $M$  : Torque on pulley (or sprocket) kgfcm
- $H$  : Input horsepower kW
- $n$  : Shaft speed rpm
- $K_b$  : Effective tension of belt (or chain) kgf
- $r$  : Effective radius of pulley (or sprocket) cm

The effective tension is the difference between tight-side tension and slack-side tension.

The radial load acting on the shaft through the pulley is obtained by multiplying the effective tension by belt (or chain) factor shown in Table 2.1 in consideration of type of the belt and starting tension.

$$F_b = f_b \cdot K_b \quad (2.3)$$

where:

- $F_b$  : Radial load on pulley (or sprocket) shaft kgf
- $f_b$  : Belt (or chain) factor

Table 2.1 Belt (or chain) factor :  $f_b$

Type of belt	$f_b$
V belt	2-2.5
Single leather belt with tension pulley	2.5-3
Double-ply leather belt with tension pulley	3-3.5
Silk belt	3.5-4.5
Single leather or rubber belt	4-5
Double-ply leather or hemp belt	5-6
Chain	1.25-1.5

Note: The shorter the distance between shafts and the lower the speed, the larger factor be taken.

#### (2) Gear drive

Operating load on the gear at gear drive can be theoretically obtained from transmission horsepower and type of the gear.

Although the flat gear is subjected only to the radial load, worm gear, bevel gear and screw gear are subjected to the thrust load in addition to the radial load. Besides them, the gears are necessarily subject to shock and vibration loads which are produced according to machining degree of finish of gear teeth.

However, as it is difficult to calculate these loads accurately, the load on the gear shaft is obtained by multiplying theoretical loads by gear factors given in Table 2.2.

$$F_g = f_g \cdot K_g \quad (2.4)$$

where:

- $F_g$  : Radial load on gear shaft kgf
- $K_g$  : Theoretical load on gear shaft kgf
- $f_g$  : Gear factor

Table 2.2 Gear factor :  $f_g$

Type of gear	$f_g$
Precision gear (tolerance of pitch and shape is within 0.02mm)	1.05-1.1
Ordinary gear (tolerance of pitch and shape is within 0.07-0.1mm)	1.1-1.3

### (3) All types of drive

As all machines and equipments are accompanied by vibrations and shocks, small or heavy, when operated, the actual operating loads on the shaft are to be obtained by multiplying these loads calculated in preceding (1) and (2) by machine factors shown in Table 2.3.

$$F = fd \cdot Fb = fd \cdot fb \cdot Kb \quad (2.5)$$

$$\text{or } F = fd \cdot Fg = fd \cdot fg \cdot Kg \quad (2.6)$$

where:

F : Actual load on pulley shaft  
(or sprocket shaft or gear shaft) kg

fd : Machine factor

**Table 2.3 Machine factor : fd**

Operating condition of machine:		fd
Rotating machines not subjected to shock loads	Motor, turbo compressor, rotary furnace	1 - 1.2
Machines subjected to light shock loads and those making reciprocating motion	Speed reducer, internal combustion engine, compressor	1.2 - 1.5
Machines subjected to heavy shock loads	Hammer mill, roller mill	1.5 - 3.0

The loads obtained in the above calculations are to be divided among the supporting bearings.

### 2) Dynamic equivalent load

Although either radial load or thrust load acts singly in some applications, bearings are more often subjected to combined loads of the radial and the thrust which vary in magnitude and direction during operation, therefore, such loads must be converted to an equivalent load for life calculation of bearings.

The dynamic equivalent load equals such load that gives the same life without fluctuation in magnitude and direction as that under actual load and speed, and for the self-contained bearings for Bearing Units, central radial load assumed when the inner ring rotates with the outer ring stationary be taken. Generally, the dynamic equivalent load can be obtained from following formula.

$$P = X V F_r + Y F_a \quad (2.7)$$

where:

P : Dynamic equivalent load kg

X : Radial factor

V : Speed factor

Y : Thrust factor

F<sub>r</sub> : Radial load kg

F<sub>a</sub> : Thrust load kg

Values of V, X and Y are as shown in Table 2.4.

**Table 2.4 Factors : V, X and Y**

$\frac{F_a}{C_0}$	Under load, inner ring is:		$\frac{F_a}{V F_r} \leq e$		$\frac{F_a}{V F_r} > e$		e
	rotating		X	Y	X	Y	
	V	V					
0.014						2.30	0.19
0.020						1.99	0.22
0.056						1.71	0.26
0.084						1.55	0.28
0.11	1	1.2	1	0	0.56	1.45	0.30
0.17						1.31	0.34
0.28						1.15	0.38
0.42						1.04	0.42
0.56						1.00	0.44

Note: C<sub>0</sub> = Basic static load rating of bearing.

## 2.2 Life and load rating

### 1) Life and basic dynamic load rating

Bearings are incessantly subjected to repetitive stresses on outer and inner rings and rolling elements during operation even if they are normally run and there eventually occur flakings in raceways and surfaces of rolling elements due to fatigue.

The bearing life is expressed in total numbers of revolution (or hours at constant speed) which a bearing attains before fatigue failure occurs on either bearing race or rolling element.

As there is variation in the lives of identical bearings operating under the same condition, the bearing life is defined as total numbers of revolution (or hours at constant speed) which 90% of group of identical bearings attain or exceed before the onset of fatigue failure when individual bearings are operated under the same condition. This life of the bearing is called Rating Life which is about 1/5 of average life of the bearing. Basic dynamic load rating represents such load that does not vary in magnitude and direction and under which rating life of the bearing will be one million revolutions with the inner ring rotating and the outer ring stationary. For the self-contained bearing for Bearing Units, central radial load is taken as the basic dynamic load rating.

### 2) Calculation of rating life

Relation among rating life, basic dynamic load rating and operating load on the bearing is formularized as follows.

$$L = \left(\frac{C}{P}\right)^3 \quad (2.8)$$

where:

L : Rating life	$10^6$ rev
C : Basic dynamic load rating	kg
P : Dynamic equivalent load	kg

When it is convenient to express rating life in hours rather than numbers of revolution, following formula is used.

$$Lh = \frac{10^6 \cdot L}{60 \cdot n} = \frac{10^6}{60 \cdot n} \left(\frac{C}{P}\right)^3 \quad (2.9)$$

where:

Lh : Life hours of bearing	h
n : Shaft speed	rpm

For life calculation of the bearing, the Nomograph shown in Fig. 2.1 which represents a relation between C/P value and rating life may be conveniently used.

### 3) Effect of operating temperature

When the bearing is operated continuously in high temperature or it is encountered with very high temperature even for a short period, there occurs a change in internal structure of bearing material resulting in decrease of hardness and consequent decrease of basic dynamic load rating of the bearing. As the operating temperature affects bearing performance when it exceeds 120°C (248°F), it is required to adjust basic dynamic load rating by deducting corresponding amount of decrease given in Table 2.5 from the basic dynamic load rating C given in dimension tables of this catalog for life calculation of Bearing Units for high temperature applications.

Table 2.5 Temperature effect on basic load rating

Temperature of bearing C (F)	135 (257)	150 (302)	175 (347)	200 (392)	225 (437)	250 (482)
Decrease of basic dynamic load rating (%)	5	10	15	25	35	40

### 4) Basic static load rating

When the bearing is stationary or it is slightly oscillating or rotating at very low speed of less 10rpm, the bearing is not subjected to repetitive stresses and there occurs no flaking on raceways and surfaces of rolling elements. Therefore, the load rating is to be determined by amount of harmful permanent deformation in raceways and rolling elements.

Basic static load rating is defined as such static load that the sum of permanent deformation of rolling elements and raceways at contact area where is subjected to maximum stress makes 0.0001 time of diameter of rolling element, and for the self-contained bearing, central radial load is to be taken as basic static load rating. This degree of deformation is not considered to be harmful for subsequent operation of Bearing Units.

### 5) Static equivalent load

The static equivalent load is defined as such static load with constant direction and magnitude that permanently deforms contacting parts of the rolling elements and bearing rings which are

subject to maximum stresses by the same amount as the maximum permanent deformation to be caused under actual loading conditions. For the self-contained bearing for Bearing Units, central radial load is to be taken as the static equivalent load.

The static equivalent load can be obtained from the following formula.

$$P_0 = X_0 Fr + Y_0 Fa \quad (2.10)$$

$$P_0 = Fr \quad (2.11)$$

where:

$P_0$  : Static equivalent load                      kgf

$X_0$  : Static radial factor

$Y_0$  : Static thrust factor

$Fr$  : Radial load                                      kgf

$Fa$  : Thrust load                                      kgf

For the self-contained bearing for Bearing Units, take the larger one of the values obtained from above calculations and also take the static radial factor  $X_0 = 0.6$  and the static thrust factor  $Y_0 = 0.5$  respectively.

### 6) Safety factor for basic static load rating

Although basic static load rating is taken as the load rating for the bearing which is stationary or slightly oscillating, less static load rating may be permitted or required according to applications.

In this case, such static load rating is to be determined taking safety factor shown in Table 2.6 into consideration.

$$P_{0max} = \frac{C_0}{f_s} \quad (2.12)$$

where:

$P_{0max}$  : Maximum static equivalent load      kgf

$C_0$  : Basic static load rating                      kgf

$f_s$  : Safety factor

Table 2.6 Safety factor :  $f_s$

Operating conditions	$f_s$
Constant shockless load acting during operation	Larger than 0.5 incl.
Normal operation accompanied by vibrations	Larger than 1 incl.
Operation under shock loads or when especially smooth operation required	Larger than 2 incl.

### 3. MOUNTING OF BEARING UNITS ON SHAFT

Bearing Units are prelubricated for immediate installation and operation providing easy handling of them, but same as ordinary bearings, they may come to early failure when not handled properly.

Bearing Units must be, therefore, handled with care and when mounting on the shaft, be careful not to apply shock loads nor permit ingress of foreign matters into the self-contained bearing.

#### 3.1 Selection of shaft

The shaft on which Bearing Units are mounted shall be free from bend and flexure.

For the units with cylindrical bore (with set-screws or eccentric locking collar) clearance fit is

usually adopted for mounting the units on the shaft, and shaft tolerances in Table 3.1 are recommended for such loose fit. But, for high speed or highly accurate operation or such application where is accompanied by heavy shock loads, interference fit is to be adopted. Table 3.2 shows recommended shaft tolerances for interference fit. When Bearing Units with eccentric locking collar are mounted on the shaft with interference fit, the eccentric locking collar may be omitted.

Tapered bore bearings permit wider tolerances of the shaft since they are locked to the shaft by means of adapter sleeves.

Recommended shaft tolerances for tapered bore bearings are listed in Table 3.3.

Table 3.1 Shaft tolerances for clearance fit for bearings with cylindrical bore

Unit: 0.001mm

**3.2 Mounting on shaft**

**1) Bearing Units with set-screws**

For normal operating conditions, Bearing Units be simply fixed on the shaft by tightening two hexagon socket head set-screws with the spanner, but to ensure positive locking it is desirable to file flat (Fig. 3.1) or drill slightly (Fig. 3.2) the shaft on the part where the set-screws contact before tightening the set-screws.

In applications where Bearing Units are subjected to vibration loads or shock loads or where heavy thrust loads act, use the shaft with shoulder and fix the units by tightening the nut as shown in Fig. 3.3. In these applications also, the set-screws must be tightened firmly enough.

Too hard tightening of the set-screws may deteriorate bearing smoothness or cause inner ring cracking and on the contrary, insufficiently tightened set-screws may loosen during operation and cause creeping between the inner ring and the shaft. Therefore, the set-screws must be tightened with proper tightening torque as recommended in Table 3.4 and Table 3.5.

As Bearing Units with specially heat-treated inner ring are free from inner ring cracking and loosening of the set-screws which are easy to occur to conventional through-hardened units, they can be secured to the shaft even in such applications where are subject to heavy repetitive loads of vibrations and shocks.

**Table 3.4 Recommended set-screw tightening torque for specially heat-treated units**

Set-screw tap		Bearing No.		Tightening torque	
Metric thread	UNF thread			kgm	inlb

Bearing Units with set-screws are mounted on the shaft in following steps.

- (1) Make sure that the set-screws do not protrude from the inside diameter of the self-contained bearing. (In case they protrude, loosen the set-screws).
- (2) Slowly slide Bearing Units on the shaft in required position. When mounting, be careful of shaft distortion and never hammer the ends of the bearing inner ring and the slinger.
- (3) Tighten the set-screws uniformly with recommended torque in Table 3.4 and fix the units to the shaft.
- (4) Fix the housing to the machine frame. The machine frame must be rigid enough and flat to prevent housing from being deformed.

## 2) Bearing Units with adapter sleeve

Bearing Units with adapter sleeve permit wider shaft tolerances and can be used in applications where vibrations and shocks are heavy.

Mounting processes of these units are as follows.

- (1) Slip the adapter sleeve on the shaft into required position.
- (2) Slide the unit on the shaft and mate the tapered bore of the self-contained bearing to counter tapered part of the sleeve.
- (3) Fit the washer and nut to the sleeve and tighten the nut by hand.
- (4) Tighten the nut with the spanner to fix the unit to the shaft.  
Be careful not to tighten the nut too hard as it may cause overheating.
- (5) Bend a tooth of the washer into the notch of the sleeve to prevent the nut from loosening.
- (6) Fix the housing to the machine frame in the same manner as the units with set-screws.

3) Bearing Units with eccentric locking collar  
Bearing Units with eccentric locking collar are mounted on the shaft by engaging the eccentric locking collar with the eccentric recessed cam in the bearing inner ring as shown in Fig. 3.5. For tightening of the collar, turn it in the direction of shaft rotation and the collar tightens automatically with the force corresponding to operating radial loads.

Then, fix the collar to the shaft by tightening the set-screws. For recommended tightening torque of the set-screws, refer to Table 3.6.

If the collar is turned to opposite direction to shaft rotation, the inner ring loosens after starting operation, then it tightens automatically in the direction of shaft rotation. The shaft may, therefore, slide in the bearing bore when the units are subjected to thrust loads.

For applications where the shaft rotates in clockwise direction and counter-clockwise direction reciprocally, it is needed to use the shaft with shoulder or the axial direction fixing collar to fix the bearing inner ring. When the inner ring has interference fit to the shaft, the eccentric locking collar may be omitted, but if the units are subjected to thrust loads, the inner ring must be fixed in the direction of shaft rotation, and in case especially heavy thrust loads operate, the shaft with shoulder must be used.

Table 3.6 Set-screw tightening torque

M8X1	5/8-24	10 207 +EE -210 +EE	120	104

#### 4) Bearing Units with covers

Mounting processes of Bearing Units with cast iron and pressed steel covers are as follows.

- (1) When the cast iron or pressed steel covers are equipped with rubber seals, fill the chamber inside the covers with the grease by about  $1/3 \sim 1/2$  full. The grease, which is to be rather solid type like the cup grease, serves for prevention of ingress of dirt and moisture from the atmosphere. (Fig. 3.4).  
For the rubber seal of the pressed cover, fill the grease in the space between lips and apply the grease to surface of the shaft on the part where the lips contact.
- (2) Slide the inner cover with the rubber seal on the shaft to required position.
- (3) Mount the unit without cover on the shaft in required position and lock it there positively. Mounting processes of the units with covers on the shaft are same as those with set-screws or adapter sleeve.
- (4) Fix the housing to the shaft by fixing bolts.
- (5) Fix the inside cover with rubber seal to the

housing by fitting it to the counter recess in the housing and tighten it with the hexagonal bolts for cast iron cover. The pressed steel cover is to be pressed into the recess in the housing. When fixing the pressed steel cover, use a wooden or plastic hammer as shown in Fig. 3.5.

- (6) Fix another cover with the rubber seal or the closed cover to the housing in the same method as above (5).

When removing the pressed steel covers, use a screw driver as shown in Fig. 3.6.

The rubber seal equipped in the cover often contacts comparatively rough unground surface of the shaft and dirt and other contaminants enter between the lips of the rubber seal. The rubber seal of the cover may be, therefore, damaged earlier than the rubber seal of the self-contained bearing and it is needed to replace the rubber seal of the cover from time to time. It is also desirable to chamfer the end of the shaft so that it may not damage the rubber seal when mounting the units on the shaft.

### 3.3 Inspection

When mounting of Bearing Units is completed, inspect if they are mounted properly. For inspection, turn the shaft by hand and check if it rotates smoothly. If no irregularity is found, run the units by the motor initially at low speed under no load, then increase speed and load up to required conditions gradually and check noise and rise of temperature during this operation.

#### 1) Noise

To inspect noise, apply a screw driver to the housing and listen to rotating sound. If there is irregularity in mounting, etc., abnormal noise can be heard.

#### 2) Rise of temperature

Measure the temperature on surface of the bearing inner ring and the housing during operation. Generally, the temperature rises up to a constant degree and it is stabilized in 2~3 hours after starting operation. But, if the units are mounted improperly, or by other irregularities, the temperature rises extremely and is not stabilized in due time.

The aboves are to be checked during running-in operation and making sure of no irregularity existing, start regular operation of the machine. It is desirable to inspect noise and rise of temperature periodically during regular operation so that any failure may be found early.

### 3.4 Allowance for shaft expansion

As Bearing Units are locked to the shaft by means of set-screw, adapter sleeve or eccentric locking collar and as spherical outside diameter of the bearing outer ring mates corresponding spherical seat of the housing, allowance for shaft expansion is quite limited compared with ordinary bearings.

Where distance between the units is short and expansion of the shaft due to heat is not expected, allowance for shaft expansion is not needed. But, in applications where the units are used in high atmospheric or operating temperature or where the units are mounted on the long shaft, the units may come to failure due to

thrust loads produced by shaft expansion unless allowance for such expansion of the shaft is provided.

When the units are to be used under such operating conditions as may cause shaft expansion, the unit on the fixed side is to be locked to the shaft firmly and the one on the other side is to be locked to the shaft by means of SH type set-screw on the part where a keyway is provided so that the shaft may expand in axial direction as shown in Fig. 3.7 or Cartridge Unit may be used as shown in Fig. 3.8. Although the former method is popularly adopted for such applications, use of Cartridge Units is desirable. For applications where shaft expansion is a factor, UCEP 200 type is available.

When SH type set-screw is used for the shaft with a key-way, recommended shaft tolerances are h7 or h8.

### 3.5 Radial internal clearance

Radial internal clearance of the self-contained bearing is specified as listed in Table 3.7 for cylindrical bore and Table 3.8 for tapered bore. Ordinary clearance (C0) is considered to be satisfactory for most applications of the units, but when the units are operated in high atmos-

pheric temperature or when temperature differential between the inner ring and the outer ring is large due to effect of the heat transmitted through the shaft or when rise of temperature is high due to high speed operation, larger clearance must be adopted for initial clearance.

## 4. LUBRICATION OF BEARING UNITS

### 4.1 Limiting speed

The limiting speed of the bearing is dependent upon type and size of the bearing, type of lubricant, method of lubrication, etc. and it is generally expressed in terms of "dn value" (bore in mm x rpm) or "dmn value" ( $\frac{d+D}{2}$  in mm x rpm).

The self-contained bearing for Bearing Units has a deep grooved internal construction, but as it is sealed by rubber seals on both sides retaining the grease inside it, the speed capacity is limited according to linear contact velocity of the seal. The limiting speed of Bearing Units with Covers corresponds to linear contact velocity of the rubber seals equipped in the cover.

The speed capacity of Bearing Units is, therefore, determined in consideration of these factors and the limiting speed of specific self-contained bearing is shown in Fig. 4.1

### 4.2 Relubrication

Bearing Units are all grease lubricated and are basically to be relubricated. The grease injected from the grease fitting by means of the grease gun flows into the bearing chamber passing through the grease groove in the housing and grease hole in the bearing outer ring.

For relubrication, it is recommended to supply the grease during operation of Bearing Units so as to avoid excessive greasing and the quantity of the grease to be supplied is about 80% of the standard fill volume at factory lubrication.

There are three types of the grease fittings available as shown in Table 4.1 and Fig. 4.2 and convenient type is to be selected according to mounting position of Bearing Units.

Fig. 4.1

Table 4.1 Type of grease fitting

No.	Type	Thread	Applicable housing	
			Type	No.
GU1	Upright	$\frac{1}{8}$ -28UNF	P, PF, PH, EP	201 - 213 305 - 313 305 - X13
			F, FC, FS, FL FA, FK, C, EDH	214 - 218 314 - 328 X14 - X20
G1	Upright	PF $\frac{1}{8}$	T	201 - 213 305 - 313 305 - X13
				214 - 217 314 - 328 X14 - X17
GU2	L 67.5°	$\frac{1}{8}$ -28UNF	T	201 - 213 305 - 313 305 - X13
				214 - 217 314 - 328 X14 - X17
G2	L 67.5°	PF $\frac{1}{8}$	T	201 - 213 305 - 313 305 - X13
				214 - 217 314 - 328 X14 - X17

Note: RP 200 type housing is equipped with G1 for all sizes.

Fig. 4.2

When many units are installed in a machine, centralized forced lubrication system is often adopted for regular relubrication, but in this case, failures by over-heating may be caused because standard type Bearing Units are not furnished with grease discharge holes. However, where operating speed is low and frequency of relubrication is less, standard type units may be used. For forced relubrication, the grease with viscosity of 385 ~ 310 (NLGI No. 0 or 1) is recommended.

Although Bearing Units are relubricable, grease relubrication is not always required according to operating condition.

Where environments are clean and operating temperature does not rise high, supplement of the grease may not be required like ordinary bearings, however, the grease becomes deteriorated in any operating condition and regular relubrication is necessarily required where operating condition is humid or rise of temperature is high.

### 4.3 Grease

#### 1) Selection of grease

As bearings are to be operated for rather long time without supplement of the grease, the grease must be of high quality.

When selecting the grease, care must be taken not to use improper grease as there are various types of grease available by mixing mineral oil and metallic soap base according to the application purpose. The lithium soap base grease is superior to others in water-proof, heat-resistance and mechanical stability and can be used in both high and low temperature operating condition. For relubrication of Bearing Units, it is desirable to use the grease with the same soap base as that originally filled.

#### 2) Quantity of grease

Quantity of the grease required for relubrication of the self-contained bearing is such that prevents metal-to-metal contact between raceways and steel balls and retainer and steel balls, lubricates friction parts of the seal and prevents ingress of dirt and moisture from the atmosphere.

### 3) Greasing interval

Greasing intervals for Bearing Units vary widely according to type and quality of the grease as well as operating condition, but in applications under normal conditions it is recommended to relubricate them at less than half of the value obtained from the following formula.

$$\log L = 4.73 - (t - 17.2) \{0.0104 + 8.46 \times 10^{-7} n\} - 0.03 \frac{nFr^{1.5}}{C^{1.9}} \quad (4.1)$$

where:

L	: Average life of grease	h
t	: Operating temperature of bearing	°C
n	: Shaft speed	rpm
Fr	: Radial load	kg
C	: Basic dynamic load rating of bearing	kg

Table 4.2 Greasing interval

Operating temperature of bearing		Greasing interval		
		Environmental condition		
°C	F	Clean	Dirty	Vary dirty heavily humid
30	122	3 years	6 months	3 months
70	158	1 year	2 months	1 month
100	212	3 months	2 weeks	1 week
130	248	6 weeks	1 week	3 days
150	302	2 weeks	3 days	Daily

#### 4.4 Range of operating temperature

As Bearing Units are used not only in normal temperature but also in high or low temperature in many applications.

Bearing Units for heat-resistance or cold-resistance application are available by using suitable kind of rubber seal and grease for specific operating temperature as shown in Table 4.3.

For heat-resistance application, decrease of load rating of the bearing must be taken into consideration and larger radial internal clearance of the bearing than normal application be taken.

Standard radial internal clearances for heat-resistance application are C3 HR4 and C4 HR5 for cylindrical bore bearing, and CT3 HR4 and CT4 HR5 for tapered bore bearing.

When temperature differential between bearing inner ring and outer ring is extremely large, suitable radial internal clearance must be determined.

Note: For application where operating temperature exceeds 150°C, consult us along with data of specification and operating condition.

Table 4.3 Range of operating temperature

Type	Range of operating temperature °C {T}	Grease	Rubber seal	Color of stinger
Ordinary application	-15 to +100 {-5 to +212}	Alvania Grease 3 {Shell}	Nitril rubber {NBR}	Black

FEATURES OF JOINBAL

High reliability

JOINBAL is manufactured with high technic attained through long experiences in production of precision bearings and it assures high reliability.

Smooth self-alignment

JOINBAL is provided with smooth self-alignment between superfinished spherical outside diameter of the inner ring and mating spherical inside diameter of the inserts or housing compensating for alignment errors or shaft deflection of the machine.

Large angle of misalignment

JOINBAL has a large angle of misalignment for smooth transmission of any complex motion.

Large load carrying capacity

JOINBAL is capable to carry radial, axial, heavy or shock load and any combined loads of any of them as it is accurately machined and assembled using selected materials for the inner ring, inserts and housing.

High wear-resistance

JOINBAL has high wear-resistance capability with high quality materials.

Easy handling

JOINBAL is a compact assembly and as it is ready for immediate application to the machine, installation is easy and free from troubles.

NUMBERING SYSTEM OF JOINBAL

Series Symbol	Housing Type Symbol	Bore Diameter Number
JA : 3-piece construction with copper alloy insert	F : Female Rod End	To indicate bore diameter of inner ring in millimeter
FB : Reinforced PTFE lined	M : Male Rod End	
JH : 2-piece construction JB : 2-piece construction	S : Spherical Bearings	

Note: For left-hand thread of Rod End types, add "L" to Rod End Number (Example : JAFL 5)

## ENGINEERING DATA

### 1. TOLERANCES

Table 1.1

Tolerance	Unit : mm
Machined parts	Tolerance
Bore diameter of spherical ball	H7
Width of spherical ball	0 - 0.1
Outside diameter of housings (JAS and JBS types Spherical Bearings)	0 - 0.012

Table 1.2

Maximum clearance	Unit : mm
Radial clearance	Max. 0.05
Axial clearance	Max. 0.15

### 2. LOAD CAPACITY

MINIMUM STATIC FRACTURE RADIAL LOADS are based on the yield point of body causing the interference with ball rotation by hand in non-loaded state after the catalog loads were applied for one minute in a static condition.

LIMIT RADIAL LOADS represent the limiting radial loads which may permit smooth ball rotation based on the experimental test conducted by applying 2.5kg radial load after unloading the catalog loads applied for one minute in a static condition.

LIMIT AXIAL LOADS represent the limiting axial load which may permit smooth ball rotation based on the experimental test conducted by applying 2.5kg radial load after unloading the catalog loads applied for one minute in a static condition.

### 3. SHAFT SELECTION

Correct shaft tolerance shall be selected, depending on the operating load and kind of loads expected in the actual application, to have a right fitting between the shaft and Rod Ends, or between outer diameter of Spherical Bearings

and inside diameter of the housing of machines. The following tables show the recommended tolerances. The shaft on which JOINBAL is to be mounted should be free from bend and bruise.

**Table 3.1**  
Recommended shaft tolerance for Rod Ends.

Unit: 0.001mm

Nominal shaft size (mm)		n6	p6	r6
over	incl.			
3	6	+16 ~ +8	+20 ~ +12	+23 ~ +15
6	10	+19 ~ +10	+24 ~ +15	+28 ~ +19
10	18	+23 ~ +12	+29 ~ +18	+34 ~ +23
18	30	+28 ~ +15	+35 ~ +22	+41 ~ +28

Note: When the load is particularly large, use r6.

**Table 3.2**  
Recommended shaft tolerance for Spherical Bearings.

Unit: 0.001mm

Nominal inside diameter (mm)		J7	K7	M7
Over	incl.			
10	18	+10 ~ -8	+6 ~ -12	0 ~ -18
18	30	+12 ~ -9	+6 ~ -15	0 ~ -21
30	50	+14 ~ -11	+7 ~ -18	0 ~ -25
50	80	+18 ~ -12	+9 ~ -21	0 ~ -30

### 4. MOUNTING INSTRUCTIONS

For normal applications, use press fitting on the shaft as shown in Fig. 4.1 (a). Where complex movements, combined or fluctuating loads are expected, it is recommended to lock by means of

nut or bolt after staking the spherical ball into the shaft as shown in Figs (b), (c) and (d). When mounting on the shaft, use a plate on the face of the spherical ball.

Fig. 4.1

## 5. ANGLE OF MISALIGNMENT

There are three different types of mounting in which JOINBAL may be used, as illustrated below, and the angle of misalignment varies according to the type of mounting adopted. Angle of misalignment is shown in each dimension table.

## 6. LIMITING OPERATING SPEED

The limiting operating speed of JOINBAL is determined by the load and peripheral velocity of the spherical ball. The maximum peripheral velocity, in case of light load, is 50m/min. Fig. 6.1 shows the coefficient between bore diameter and allowable speed.

## 7. LUBRICATION

JOINBAL is normally lubricated with grease. The grease is pumped in through grease hole on the housing of Rod Ends, or supplied into the grease reservoir through grease groove on the outside diameter of Spherical Bearings.

Note: As JOINBAL is not factory-lubricated, lubricate it when mounting on the shaft.

Select proper grease with care, among many kinds of grease available, to meet the specific application. Generally, lithium-based grease having the advantages in water-resistance, heat-resistance and mechanical-stability for both high and low operating temperature, is recommended.

JOINBAL should be relubricated while it is rotating with a proper amount of grease until the newly supplied grease oozes out between the spherical ball and housing.

The length of interval between greasing is dependent on the operating conditions and type of grease. The following Fig. 7.1 covers most situation and can be used as a guide. Generally, the range of operating temperature is  $-15^{\circ}\text{C} \sim +100^{\circ}\text{C}$ .

Note: For applications where operating temperature exceeds  $+100^{\circ}\text{C}$ , consult us.

Fig. 7.1
